To meet the current challenges of the maritime sector, Easypart has developed My ETA, an application that makes it possible to forecast ship arrival times more reliably. This **tool is based on advanced artificial intelligence algorithms** and the **use of data from SOGET's Port Community System S)ONE and HAROPA PORT.**

Using a container number, a goods identifier or a ship reference, the application displays a date range for the arrival of goods in port. It can also be used to retrace the route of goods, providing users with visibility in the form of a timeline. Forecast dates are entered and then updated with the actual dates, giving supply chain players complete visibility of the goods' journey from end to end.

In the future, My ETA plans to improve its performance by taking into account unforeseen events such as changing weather conditions, shipping incidents, geopolitical tensions, etc.

Good to know: HAROPA PORT will be hosting the next edition of the Assises du port du futur 2025 in Le Havre.
